Foreword

The 1997 Hydrometric Report is the third document of its kind to be produced since the formation of the Environment Agency (South West Region) from the National Rivers Authority, Her Majesty Inspectorate of Pollution and Waste Regulation Authorities. The document is the fourth in a series of reports produced on an annual basis when all available data for the year has been archived.

The principal purpose of the report is to increase the awareness of the hydrometry within the South West Region through listing the current and historic hydrometric networks, key hydrometric staff contacts, what data is available and the reporting options available to users.

If you have any comments regarding the content or format of this report then please direct these to the Regional Hydrometric Section at Exeter. A questionnaire is attached to collate your views on the annual hydrometric report. Your time in filling in the questionnaire is appreciated.

1.1 Introduction

This report is the fourth document of its kind to cover all the hydrometric stations in the South West Region. The report reviews the weather conditions and notable hydrological events during 1997.

The current site listings of surface water gauging, groundwater and rainfall stations present reference information for each site, together with the Area offices responsible for data collection and processing. Summary statistics for 1997 and updated long term averages have also been compiled for each current station. Hydrometric staff contacts within each area and regional office are listed for information. Only sites where hydrometric staff are responsible for data collection and processing have been included in this report. An additional feature of the 1997 annual report is the inclusion of site listings and location maps for historic groundwater and rainfall sites. The location maps have been produced using the G.I.S. system Arcview. The themes for current gauging stations and both current and historic groundwater and rainfall sites are to be stored on the G.I.S. servers in order to be available to G.I.S. users and those with access to Mapexplorer across the region.

The data archiving systems and standard reports for data analysis and presentation are briefly outlined to help staff tailor their information requests. Convergence of systems has continued with all Areas within the South West region using Hydrolog, Rainark and Gaugeman. All Areas will be using the Gaugeman systems and a common spot flow gaugings database (SFM) will store current meter gaugings from all 4 Areas and be available to all users with Access 97. Additional hydrometric reports and sources of information are also included for reference in section 6. A Service Level Agreement for the provision of hydrometric data is in operation between hydrometric staff and the Client Board. The Service Level Agreement specifies the sites at which data will be available on the archives with set timescales and also specifies the accuracy of the data from sites. Further information relating to the SLA is available from the Senior Hydrologist and members of the Client Board whose chairman is Bill Grigg.

The regional hydrometric section, has compiled this annual hydrometric report with support from Area hydrometric colleagues, notably with the compilation and verification of the hydrometric site inventories.

1.2 Hydrometric Staff Contacts

The Hydrometric staff in the South West Region are listed below in alphabetical order by office. The principal points of contact in each office are the Team Leaders of each Area Water Resources section and the Senior Hydrologist at the Regional office. Water

Resources staff involved in hydrometry are listed alphabetically in each Area Water Resources section.

Area and Regional Hydrometric Contacts.

<u>Cornwall Area:</u>	Graeme Boyce Roger Bailey	Water Resources Team Leader Water Resources Officer
	Stephen Marks Ian Barker Adam Gilbert Chris Ridge Gill Skinner	Hydrologist Hydrometric Officer Hydrometric Officer Hydrometric Officer Water Resources Licensing Assistant
<u>Devon Area:</u>	Ann Riley Paul Mason	Water Resources Team Leader Water Resources Officer
	Anne Kemlo Chris Beer Suzanne Fuller Mike Sampson Liana Smeath Tom Walling	Hydrologist Hydrometric Officer Hydrometric Officer Hydrometric Officer Water Resources Assistant Hydrometric Officer

	Vacancy Gareth Varney Damian Mason Jim Wregglesworth Stuart Goodman	Hydrologist Hydrometric Officer Hydrometric Officer Hydrometric Officer Hydrometric Officer

1.3 South West Region Hydrometric Network Overview

The South West region covers 20,802 square kilometres and features over 10000 kilometres of main river. The main hydrometric networks consist of 185 flow gauging stations; 303 groundwater stations and 552 rainfall stations in the South West Region. Details for 769 historic groundwater and 1050 historic rainfall sites are included in Tables 6a and 7a respectively. A further breakdown of the numbers of different type of stations is shown in Table 1. In addition, 23 special investigation sites were also in operation during 1997. Hydrometric staff undertook approximately 2953 gaugings during 1997.

Figure 1, shows the spatial variation in 1961-1990 annual average rainfall totals across the region together with the 1997 annual rainfall totals, these are expressed as a percentage of the long term average within each MORECS (Meteorological Office Rainfall and Evaporation Calculation System) 40km by 40km grid square. The majority of Annual rainfall totals within each MORECS square are near to the 1961-1990 long term average. Rainfall totals in Devon and Cornwall are generally higher than in Wessex (Figure 1) and river flows in Devon and Cornwall generally react more quickly to rainfall and have a flashier regime than those in Wessex. The highest annual rainfall totals of up to 2200mm occur on Dartmoor and Exmoor. Groundwater resources are extensive in the Wessex areas in comparison to Devon & Cornwall and represent an important resource whereas groundwater resources are only locally important in parts of Devon.

Figure 1: Spatial variation in Annual Long Term Average and 1997 Areal Rainfall Totals (Data supplied by the Meteorological Office).

2.1 Hydrological summary : overview 1997

Areal rainfall totals, using Catchment Areal Rainfall Programme (C.A.R.P.) data, are close to average for the region as a whole in 1997 at 103% of the 1961-90 long term average, (102% of average in Devon & Cornwall and 105% of average in Wessex, (Table 2)). The water resources situation in the early months of 1997 was influenced by a run of much drier than average months, notably January, March and April, and the longer antecedent influence of the cumulative rainfall deficit since March 1995 (Figure 2a). Figure 2a shows cumulative rainfall totals for selected 3 year periods, with each 3 year period running from March of the first year to the month on the x axis of the final year. The rainfall deficit for the period March 1995 to 1997 is notable; (By the end of 1996 the cumulative rainfall total for the 22 month period was just 91% of average, the only lower totals in the last 4 decades being recorded for the same periods in 1990/91). Despite February 1997 rainfall totals being 167% of average the areal rainfall totals for the first four months of the year were just 64% of average. December 1996 also only received 36% of average rainfall for the month, the rainfall deficit for the 1996/97 winter recharge period is shown in Figure 2b. May and particularly June 1997 were well above average, months then alternated between much drier and much wetter than average (July 53%, August 219%, September 39%). Areal rainfall totals for October, November and December combined, were above average at 124%. As the 3 months represent 39% of the annual rainfall total, this wet spell resulted in rainfall totals for the year recovering to near or just above average. Rainfall statistics in 1997 are covered in more detail in the month by month summary in section 2.2 below.

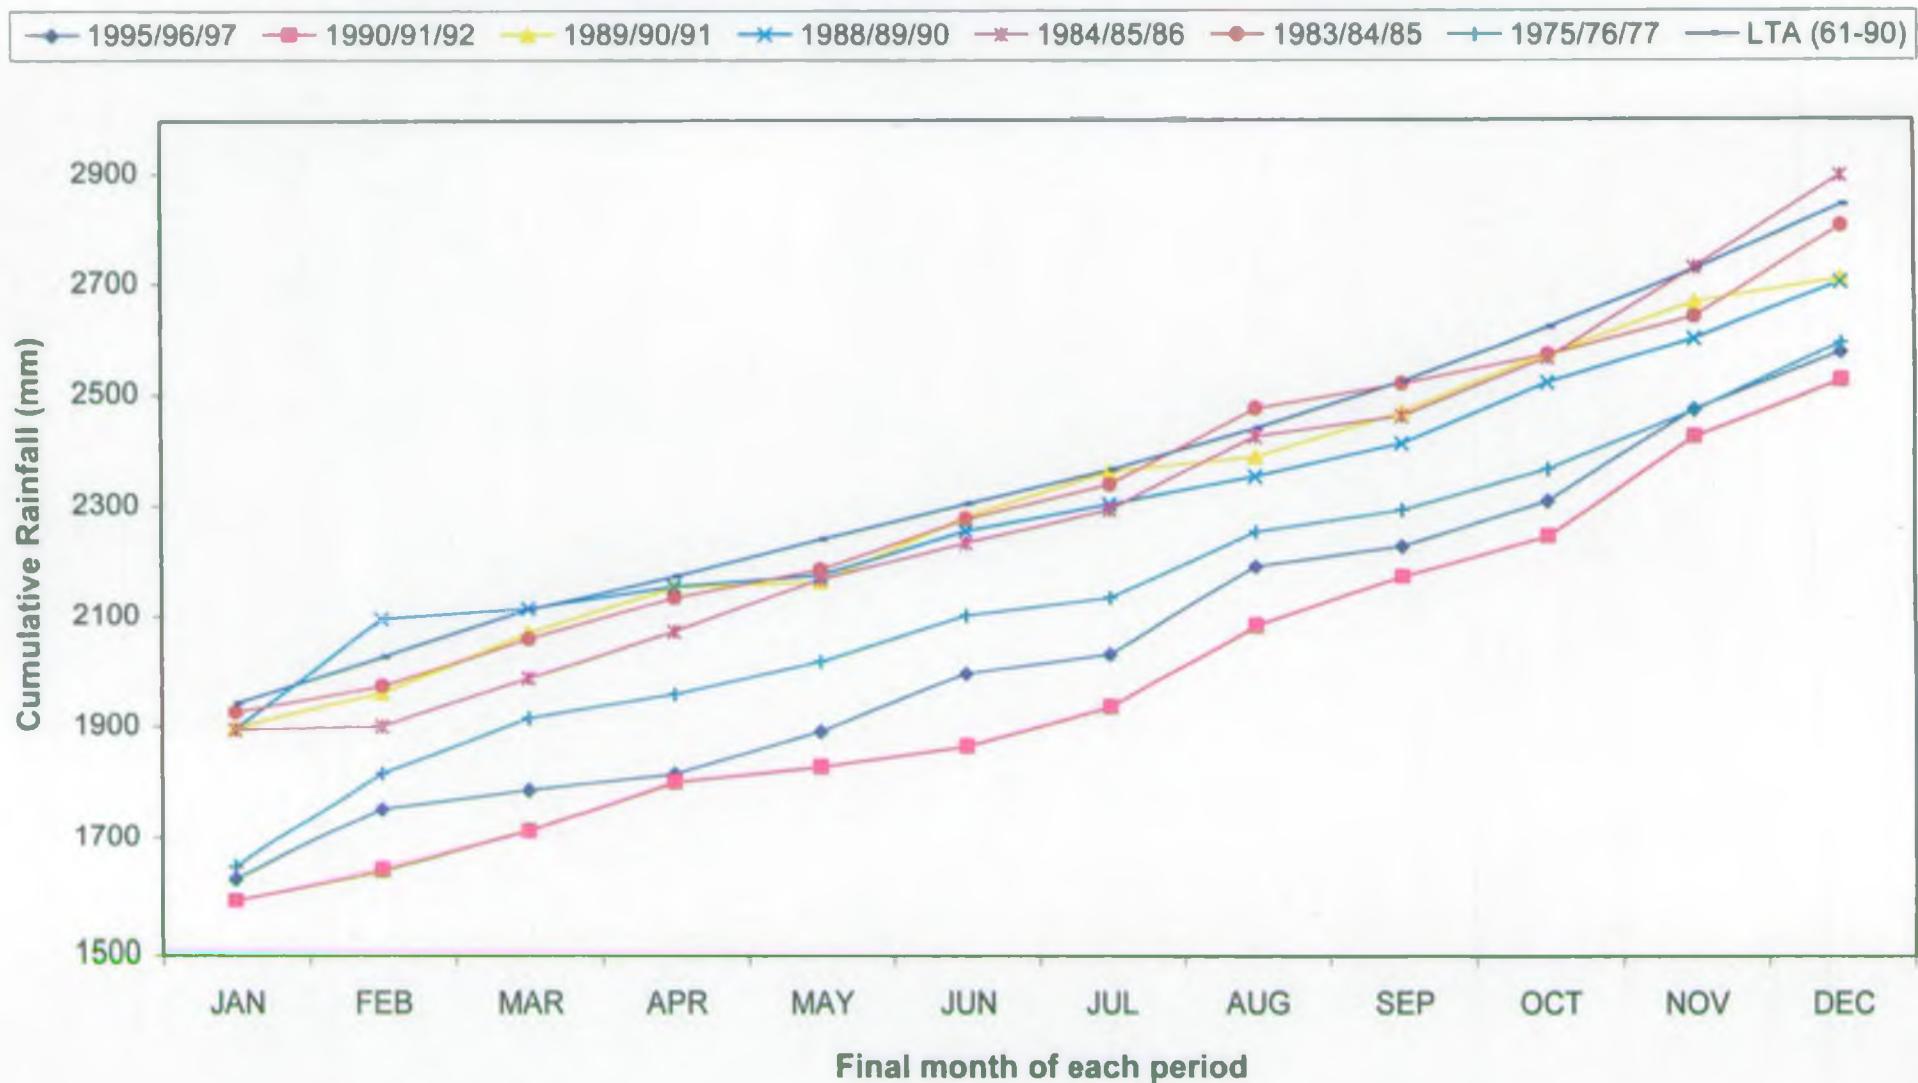

The 1996 report stated that flows declined quickly with the return to dry conditions during June and July 1996 and below average flows were recorded at the majority of indicator stations during the rest of 1996, with the notable exception of November. Flows were also below average for much of 1997 (Table 3). It is notable in Table 3, that flows at 22 or more of the 24 indicator stations were below 94% of average during 5 months of the year and a majority were below 94% of average during 9 months. Only August, November and December had a majority of site recordings greater than 106% of average flows. Sites such as Amesbury and Knapp Mill, recorded below average monthly mean flows during the whole of 1997, with the highest mean monthly flow at Amesbury representing just 66% of the average mean monthly flow for that month. The above average rainfall during the last 3 months of the year resulted in flows improving at all indicator stations and being above average at the majority, markedly in November when 16 were in excess of 125% of average flows.

Variations in regional soil moisture deficits during 1997 are shown in Figure 2c. Soil moisture deficits were generally above average during the first 7 months of 1997 and generally below average during the last 5 months of the year. The most notable deviations from the average soil moisture deficits occurred in April and May, when due to the run of dry months soil moisture deficits were typically double the average, for the time of year. Late July and August, however, were wetter than average and soil moisture deficits were typically half the average for the time of year. Soil moisture deficits increased during September to just below average conditions and generally remained just below average for the remainder of the year. The variation in reservoir storages available to the 3 water companies in the region are shown for information in Figure 3. Recharge during the 1995/96 and 1996/97 winters was limited by the combination of high soil moisture deficits at the end of the preceding summers and the below average rainfall over the catchments to the strategic reservoirs, located inland on the hills during the winter recharge periods. Both South West Water and Wessex Water began 1997 with below average reservoir storages for the time of year. Bristol Water, however, was above average for the first few weeks of the year, but fell below average to result in all 3 companies being below average during early February 1997. The annual trends for the three companies show marked differences, but all finish the year with average or above average reservoir storages. Bristol Water is above average from late February throughout the year with near average conditions during late April and early May. Reservoir storages available to South West Water, by contrast, remained below average throughout the year until September, when the rate of recovery and reservoir storages rose close to average. Wessex Water storage changes are different again, with the first half of the year being below average and the second half being significantly above average (Figure 3).

IMPOUNDING RESERVOIR STORAGE (ML)

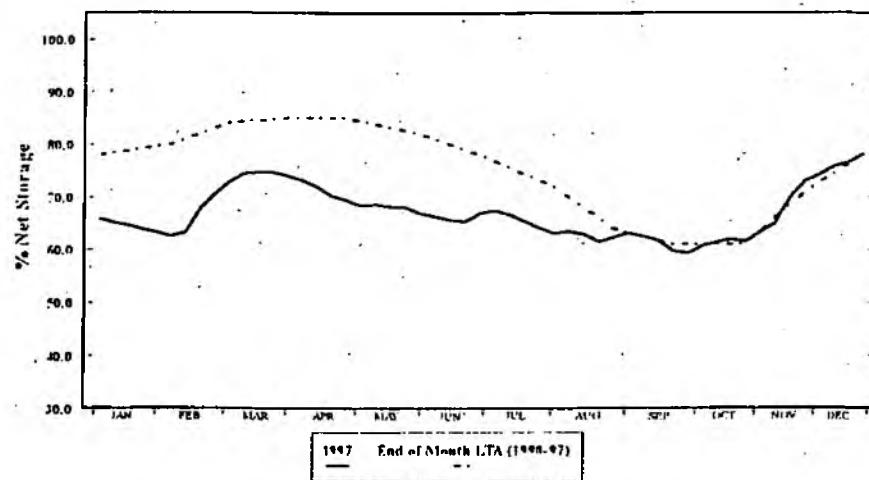

(Note: Wessex Water Plc. & South West Water Plc. = Net Storage, Bristol Water Plc. = Gross Storage)

BRISTOL WATER Plc. Reservoir Storage

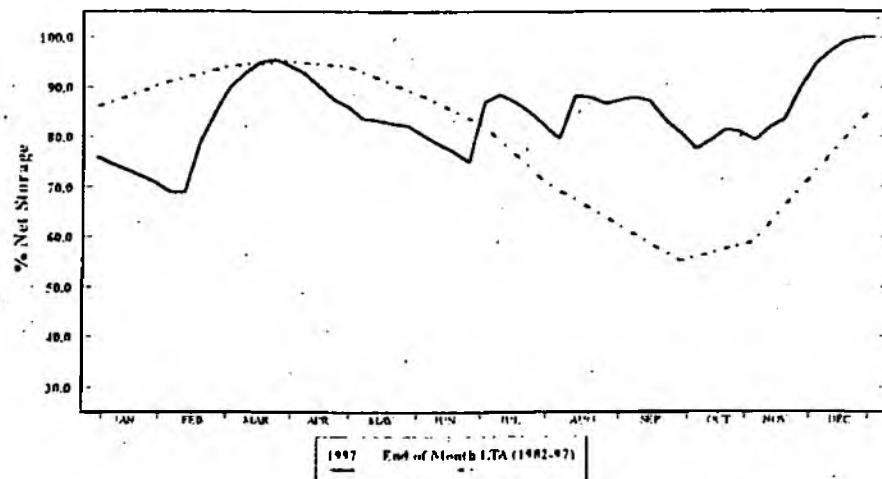

SOUTH WEST WATER Plc. Reservoir Storage

(Assumes 1% of Wimbleball gross storage not usable & 50% of usable storage to South West Water Plc.)

WESSEX WATER Plc. Reservoir Storage

(Assumes 10% of Wimbleball gross storage not usable & 50% of usable storage to Wessex Water Plc.)

2.2 1997 Monthly hydrological summary:

This section provides a more detailed summary of the water resources situation on a month by month basis.

January 97, continued the cold and dry trend from December 1996, with just 16% of the average rainfall. Long term record sites show that the December 96 to January 97 together represent one of the driest such periods this century. Figure 2a shows that a considerable rainfall deficit (just 85% of the long term average rainfall for the South West Region) had accumulated between March 1995 and January 1997. This was equal lowest with the 1975/76/77 and 1990/91/92 periods, some 300mm below any other period in the last 4 decades. The highest daily rainfall total was just 10.9mm at North Hessary on the 18th, with most of the monthly rainfall falling between the 16th and 19th. The 12 months to the end of January 1997 received just 80% of the 1961-90 long term average rainfall.

Given the dry conditions, January flows were well below average, ranging from just 12% to 46% of average at the indicator stations. The combined impact of the dry January and dry antecedent conditions is clearly shown by the considerable number of stations with new period of record minimum daily mean and minimum monthly mean flows for January (section 2.3), including a number of stations with records going back to the 1960s and even the 1950s.

Groundwater levels continued to decline and were well below average for the time of year due to the limited recharge during December 1996 and January 1997. Reservoir storages were declining at a rate of between 4% and 7% of total storage during January, at a time of year when they should have been recovering. Reservoir storages were below average in all 3 major companies by the end of January (South West Water 62%, Bristol Water 74% and Wessex Water 69% of average), however, levels were higher than at the same time in 1996.

February was a wetter than average month, with individual rainfall stations receiving between 101% and 193% of the average. The highest daily total at the indicator stations was 53.1mm at Princetown on the 11th. Rainfall occurred throughout the month, with the highest daily totals being recorded on the 4th, between the 9th and 12th, 17th and 19th and 23rd to 24th of February.

The accumulated rainfall deficit over preceding months reduced the impact of the above average rainfall on river flows. Many sites, including several with records dating back to the 1960s recorded new minimum daily mean flows for February in the first few days of the month. Mean monthly flows at indicator stations ranged from just 35% to 161%

Even though soil moisture deficits were reduced to near zero by the end of the month, groundwater levels continued to remain well below average for the time of year. Peak flows were generally short lived, with fairly steep recession following the end of higher rainfall day totals. Catchments where contribution from groundwater is important were still recording well below average flows. Only the indicator stations in Devon recorded above average flows (133% of average), with North Wessex flows being near average and Cornwall and South Wessex below average for February.

Reservoir stocks increased in all three major water company areas. Bristol Water increased from 74% to 96% above average for the year (Figure 3), South West Water increased from 62% to 73% and Wessex Water increased from 69% to 90%. Storages for South West Water and Wessex Water remained below average for the time of year.

Rainfall records for March show a return to drier than average conditions. Areal rainfall totals were just 42% of average with individual indicator stations ranging from 29% to 50% of average. The highest daily total at the indicator stations was 34.2mm at Culdrose on the 3rd.

Flows were in recession for most of the month with any peaks occurring between the 3rd and 5th of the month. Mean monthly flows at individual stations ranged from 49% to 117% of average. Relatively few stations recorded new lowest or highest flow, established during March. Soil moisture deficits rose more quickly than usual for the time of year to above average levels by the end of the month. Groundwater levels remained below, or at best, close to average for the time of year. Reservoir storages at the end of the month were at or above average in Wessex Water and Bristol Water, but remained below average in South West Water (Figure 3).

The drier than average conditions continued during April. The areal rainfall total was 40% of average, with individual indicator stations varying between 22% and 65% of average. A blocking high centred over Western Europe resulted in no rain falling until the last week of April when there was a period of short heavy showers. Considerable rainfall deficits had accumulated over the previous months (December 1996 to April 1997 received just 56% of the long term average rainfall for this period and the period March 1995 to April 1997 received just 87% of the average rainfall). The highest daily rainfall total at the indicator stations was 22.1mm at North Hessary on the 26th. Flows were generally in recession for a second month running. Mean monthly flows ranged from just 20% to 71% of average for the time of year at the indicator stations. New minimum monthly mean and daily mean flows for April were recorded on many rivers across the region, including a number with flow record going back to the 1960's (section 2.3).

Soil moisture deficits increased rapidly to double the average for the time of year (Figure 2C). Groundwater levels in the main aquifers were below average across the region. Reservoir storage available to the 3 companies decreased at a faster rate than usual for the time of year resulting in Bristol Water storages being average for the time of year and both Wessex Water and South West Water were well below average by the end of April.

May was a wetter than average month, with the whole region receiving 115% of average. Individual indicator sites ranged from 92% to 147% of average. The highest daily rainfall total of 23mm was recorded at North Hessary on the 3rd of the month. The majority of rain fell between the 3rd and the 12th May and the 17th and the 20th May, the last 10 days remaining dry. This dry spell reversed the reduction in soil moisture deficits during the wetter parts of the month and resulted in a 50% increase in soil moisture deficits over the month as a whole. Flows recovered from low base levels during the first half of the month, with mean monthly flows at indicator stations ranging from 76% to 106% of the May average. Flows peaked around the 19th of the month and then recessed as dry conditions prevailed for the last third of the month. A number of stations, including several with records going back to the 1960's, recorded new minimum daily mean flows for May in the first and last few days of the month. The small decline in reservoir storages over the month was less than the average for the time of year. The rainfall was insufficient to improve aquifer storage and groundwater levels remained at or below average for the time of year.

June was a wet month, with 179% of the average rainfall recorded across the region as a whole. Totals at indicator stations ranged from 122% to 218% of average. The highest rainfall totals in comparison to long term averages occurred in a band covering Exmoor, West Somerset and East Devon. The highest daily total at the indicator station was 107mm at West Bagborough on the 26th. Rainfall was spread throughout the month with the highest daily totals being on the 2nd, 5th, 10th, 18th, 20th, 24th and 26th of June. For the region as a whole it was the wettest June since 1991. Soil moisture deficits were nearly halved during the month, reducing from 75mm to 45mm.

Catchments where groundwater levels have a strong influence upon flows were still recording flows well below average, whilst other catchments responded strongly to the rainfall accumulations, with notable peaks occurring around the 27th. Mean monthly flows at indicator stations varied considerably across the region from just 41% to 237%. For the first month this year June provided more new maximum flows than minimum flows records. New maximum daily mean and maximum instantaneous flows for June were recorded at many sites around the 26th and 27th, including Thorverton which has been recording flows since 1956, and maximum mean monthly flows were established at several sites. The above average rainfall provided a timely boost to the water resources situation and helped reduce demand levels. Reservoir storages available to Wessex Water rose from 80% to 87% during the month, whilst the storages in South West Water and Bristol Water remained relatively constant.

July saw a return to drier conditions with an areal rainfall total of just 54% of the average. Individual rainfall stations varied considerably from 32% to 84% of average. The highest daily total was recorded at Princetown on the 2nd with 24mm of rain. The majority of days were dry and rainfall was restricted to showers on the 1st, 3rd, 12th, 16th, 23rd and 29th of July. Soil moisture deficits doubled during the month (Figure 2c). Mean monthly flows again varied considerably across the region from 45% to 158% of average.

A number of sites established new maximum daily mean and maximum instantaneous flows on the 1st of the month, a similar number of sites had established new minimum daily mean flows by the end of July. Reservoir storages declined in line with seasonal expectations.

The pattern of alternating wet and dry months continued with August being much wetter than average. The areal rainfall total was 205% of average and individual rainfall stations recorded 130% to 311% of average. The highest daily total was 79.6mm at Cudrose on the 3rd. Most of the rain fell as localised heavy storms from the 3rd to the 5th, the 12th and from the 18th until the end of the month. The first week was wet with rain on most days including storms in Cornwall on the 3rd, and in East Devon on the 7th, (notably Ottery St. Mary where some 70mm fell in less than an hour). Areal soil moisture deficits declined from 89mm on the 30th July to 25mm on the 3rd September. This reduction was the first significant and most sustained period of below average deficits during the whole of 1997 (Figure 2c).

Mean monthly flows varied considerably across the region. For example at Bishops Hull flows ranged from just 57% to 557%, due to the event around the 6th August. Many other sites, in addition to Bishops Hull, whose flow records go back to 1961, established new maximum daily mean flows for August, on and around the 6th. A number of sites also established new maximum instantaneous flows on the 6th and new maximum monthly mean flows. In contrast, some catchments where groundwater has a strong influence upon flows established new minimum daily mean and minimum monthly mean flows (section 2.3). Wessex Water and Bristol Water reservoir stocks were above the long term average at 87% and 72% respectively, whilst South West Water remained below average at 62% on the 1st September.

September received only 39% of average rainfall. Indicator station totals varied from just 26% to 98% of average. The highest daily total was 32.7mm at Princetown on the 2nd. The majority of rain fell between the 1st and 3rd and on the 19th September. After the 21st of September only minor daily totals were recorded. Soil moisture deficits doubled over the month in response to the drier conditions and reached near average by the 30th.

Mean monthly flows at indicator stations across the region ranged from just 40% to 192% of average. Around a dozen sites with relatively short records established new

maximum daily mean flows near the beginning of the month and a similar number of sites established new minimum daily mean flows near the end of the month. Despite a decline in reservoir stocks during September, storages were still well above average for Wessex Water and Bristol Water and only just below average in the South West Water reservoirs.

October was a drier than average month. The areal rainfall total was 83% of the monthly long term average and totals for individual indicator stations ranged from 68% to 120% of average. The highest daily total was 37.9mm at Gawlish on the 9th. The beginning and end of October were mainly dry with the majority of the rain occurring between the 5th and 20th October. Mean monthly flows at the indicator stations varied considerably from just 36% to 97% of average. More than 20 sites established new minimum daily mean flows for October between the 1st and the 5th, including Amesbury and Laverstock whose records both start in 1965. Between the 8th and 11th several sites with shorter periods of record established new maximum daily mean flows and maximum instantaneous flows for October. Reservoir storages were relatively stable over the month with slight increases in South West Water and Wessex Water, and a modest decline in Bristol Water.

November was a very wet month characterised by persistent bands of showery activity and frontal systems bringing higher daily rainfall totals. The areal rainfall total was 163% of the November long term average with individual indicator station totals varying between 108% and 195% of average. The highest daily total was 55mm recorded at Bastreet on the 17th. Based on rainfall figures since 1970, November 1997 was the fourth wettest November for Devon and Cornwall and the 3rd wettest November for North and South Wessex. Soil moisture deficits were reduced to near zero for much of the month. Indicator groundwater sites recovered strongly in South Wessex to above average levels for the time of year, whilst sites in Devon and North Wessex remained below average, despite recovering during the month. Mean monthly flows varied by even more than in previous months from 54% to 241% of average. River flows recovered strongly during the month and flood warnings were issued in many catchments, notably East Devon and West Dorset. A considerable number of new flow records were established at a number of sites (section 2.3). Early in the month, between the 1st and 5th, many sites developed new minimum daily mean flows, whilst on the 27th and 28th sites established new maximum daily mean and maximum instantaneous flows for November including site with flow records dating back to the 1960s and 1970s. Reservoir storages steadily increased throughout November. By the end of the month Wessex Water and Bristol Water were well above average at 95% and 71% capacity respectively, whilst South West Water was just above average at 73% of capacity.

December, in contrast to previous months, received near average rainfall at 102%, with indicator stations recording between 67% and 121% of average. The highest total at the indicator stations was 29.1mm at Princetown on the 30th. Soil moisture deficits remained near zero for most of the month. The recovery in groundwater levels continued during

December with most indicator sites ending the month above average for the time of year. Mean monthly flows at the indicator stations were also generally above average for the time of year. In comparison to previous months, only a few sites established new flow records for December. The majority of these were at sites with relatively short records, but Fairmile and Upavon East, with records dating back to 1978 and 1971 respectively, both established new minimum daily mean flows around the middle of the month. Reservoir stocks steadily increased throughout December. By the end of the month Wessex Water and Bristol Water were well above their long term averages at 100% and 89% respectively, whilst South West Water was just above average at 78%.

2.3 Notable flows during 1997.

River flows during 1997 have been summarised by highlighting the notable flows featured in some standard reports in Hydrolog to compare maximum instantaneous flows, daily mean flows and minimum daily mean flows for particular months. In addition to these short duration events, longer term maximum and minimum monthly mean flows and annual means are also reported. This data trawl has resulted in the following notable statistics:

The majority of sites recorded below average flows for the year as a whole with only August, November and December recording above average flows.

January 1997:

New minimum daily mean flow at: Bessom Bridge (1992) 30th, Broomhill (1988) 16th, Pixton (1966) 31st, Salston (1976) 1st, Upton (1993) 9th; Upton Tributary (1993) 10th, Bellever (1964) 9th, Ermington (1973) 31st, Gribbleford Bridge (1988) 8th, Collard Bridge (1995) 31st, Leehampford Bridge (1979) 31st, Parkham (1975) 30th, Norley Bridge (1988) 9th, Rockhay Bridge(1988) 10th, Jacobstowe (1973) 15th, Torrington (1960) 10th, Umberleigh (1958) 10th, Veraby (1968) 30th, Woodleigh (1965) 31st, Woodlands (1977) 15th, Gorhuish (1990) 9th, Bastreet (1972) 31st, Bealsmill (1976) 31st, Crowford Bridge (1972) 9th, Germansweek (1991) 15th, Hayne Bridge (1988) 9th, Moors Mill (1992) 14th, Lumburn Bridge (1976) 19th, Roadford (1986) 9th; Polson Bridge (1987) 9th, Werrington Park (1978) 10th, Bissoe (1994) 31st, Craigshill Wood (1971) 20th, Devoran (1994) 30th, Restormel (1961) 29th, Trengoffe (1969) 31st, De Lank (1969) 31st, Denby (1964) 31st, West Lucombe (1973) 30th, Beggearn Huish (1983) 28th, Ashford Mill (1962) 1st, Swill Bridge (1967) 30th, Bishops Hull (1961) 2nd, Curriypool (1971) 14th, Fenny Castle (1964) 8th, Greenham (1967) 28th, Halsewater (1961) 8th, Higher Alham (1982) 31st, Henley (Wookey) (1994) 24th, Milverton (1991) 29th, Iwood (1973) 30th, Pen Mill (1963) 11th, Lovington (1964) 31st, Somerton (1965) 9th, Westhay (1993) 1st, Bath Ultrasonic (1976) 31st, Brokenborough (1978) 20th, Calstone (1982)

2nd, Sherston, Carriers Fm (1978) 30th, Compton Dando (1958) 31st, Bitton (1973) 20th, Fosseway (1976) 31st, Frenchay (1961) 1st, Garsden (1992) 20th, Frome (1992) 1st, Middlehill (1981) 31st, Rodbourne (1968) 31st, Midford (1961) 27th, Semington (1953) 7th, Tetbury, Slads Fm (1979) 31st, Trowbridge (1984) 31st, Tellisford (1961) 30th, Vallis (1980) 30th, Wellow (1966) 21st, Berkeley Kennels (1978) 28th, Loudsmill (1969) 31st, East Stoke Flume (1961) 31st, All Hallows (1992) 30th, Amesbury (1965) 2nd, Bowerswain (1992) 18th, Brixton Deverill (1992) 30th, Colesbrook (1973) 10th, East Mills Weir (1965) 31st, Hammoon (1990) 10th, Loverley Mill (1970) 21st, Laverstock (1965) 31st, Upavon West (1972) 1st, Stockton Park (1994) 27th, South Newton (1967) 30th, Throop (1973) 27th, Walford Mill (1974) 21st, Broadwey (1975) 29th.

Lowest mean monthly flow at : Bessom Bridge (1992), Broomhill (1988), Fairmile (1978), Pixton (1966), Salston (1976), Staplake (1970), Stoodleigh (1960), Thorverton (1956), Upton (1993), Upton Tributary (1993), Woodmill (1962), Austins Bridge (1958), Bellever (1964), Dunnabridge (1972), Ermington (1973), Gorhuish (1990), Leehampford Bridge (1979), Parkham (1975), Norley Bridge (1988), Rockhay Bridge (1988), Meldon (1975), Jacobstowe (1973), Taw Bridge (1973), Torrington (1960), Umberleigh (1958), Vellake (1968), Veraby (1968), Woodleigh (1965), Woodlands (1977), Gribbleford Bridge (1988), Gorhuish (1990), Collard Bridge (1995), Bastreet (1972), Bealsmill (1976), Crawford Bridge (1972), Germanwseek (1991), Gunnislake (1956), Hayne Bridge (1988), Pillaton Mill (1966), Lifton Park (1969), Ludbrook (1981), Lumburn Bridge (1976), Moors Mill (1992), Puslinch (1966), Tinhay (1969), Polson Bridge (1987), Roadford (1986), Werrington Park (1978), Craigshill Wood (1971), Bissoe (1994), Devoran (1994), Restormel (1961), Denby (1964), Trengoffe (1969), De Lank (1969), West Luccombe (1973), Beggearn Huish (1983), Clyse Hole (1992), Fenny Castle (1964), Helland (1994), Higher Alham (1982), Henley (Wookey) (1994), Milverton (1991), Iwood (1973), Lovington (1963), Westhay (1993), Bath ultrasonic (1976), Bathford (1969), Brokenborough (1978), Calstone (1982), Sherston, Carriers Farm (1978), Bitton (1973), Fosseway (1976), Frampton Cotterell (1978), Frenchay (1961), Garsden (1992), Frome (1992), Great Somerford (1963), Middlehill (1981), Rodbourne (1968), Midford (1961), St Dunstans Spring (1981), Nunney (1985), Stanley (1970), Torr Quarry (1981), Tetbury, Slads Fm (1979), Trowbridge (1984), Tellisford (1961), Vallis (1980), Wellow (1966), Berkeley Kennels (1978), South House (1993), Upwey (1989), Dewlish Woodsdown Cross (1992), Little Puddle (1993), Litton Cheney (1992), All Hallows (1992), Bowerswain (1992), Brixton Deverill (1992), Hammoon (1990), Hurn Court (1992), Stockton Park (1994), Briantspuddle (1993).

February 1997:

Lowest mean monthly flow at : Staplake (1970), Woodlands (1977), Bath Ultrasonic (1976), Calstone (1982), Trowbridge (1984), South House (1993), Upwey (1989), Little Puddle (1993), Litton Cheney (1992), Stockton Park (1994), Briantspuddle (1993).

Highest mean monthly flow at : Bessom Bridge (1992), Fenny Bridges (1974), Pixton (1966), Upton (1993), Upton Tributary (1993), Whitford (1964), Leehampford Bridge (1979), Collard Bridge (1995), West Luccombe (1973), Beggearn Huish (1983), Swill Bridge (1967), Clyse Hole (1992), Milverton (1991), Bath Hot Springs (1991), Brixton Deverill (1992).

July 1997:

New minimum daily mean flow at : Stowford (1973) 23rd, Bath Ultrasonic (1976) 30th, Frenchay (1961) 20th, Semington (1953) 8th, Nunney (1985) 4th, Stanley (1970) 10th, Tetbury, Slads Fm (1979) 27th, Trowbridge (1984) 28th, Loudsmill (1969) 23rd, South House (1993) 29th, Amesbury (1965) 23rd, East Mills Flume (1963) 29th, Laverstock (1965) 29th, Upavon West (1972) 23rd, Stockton Park (1994) 24th, Upavon East (1971) 21st, South Newton (1971) 23rd, Wilton (1966) 29th.

New maximum daily mean flow at : Bessom Bridge (1992) 1st, Fairmile (1978) 3rd, Upton (1993) 1st, Upton Tributary (1993) 1st, Collard Bridge (1995) 1st, Lumburn Bridge (1976) 3rd, Bissoe (1994) 2nd, West Luccombe (1973) 1st, Beggearn Huish (1983) 1st, Swill Bridge (1967) 1st, Bishops Hull (1961) 3rd, Curriypool (1971) 3rd, Greenham (1967) 2nd, Halsewater (1961) 9th, Helland (1994) 2nd, Henley (Wookey) (1994) 6th, Milverton (1991) 9th, Sherston, Carriers Farm (1978) 28th, Crab Mill (1969) 20th, Brixton Deverill (1992) 1st.

New maximum instantaneous flow at : Bessom Bridge (1992) 1st, Fairmile (1978) 3rd, Upton (1993) 1st, Upton Tributary (1993) 1st, Collard Bridge (1995) 1st, Bissoe (1994) 2nd.

Lowest mean monthly flow at : Stowford (1973), Bath Ultrasonic (1976), Calstone (1982), Trowbridge (1984), South House (1993), Dewlish Woodsdown Cross (1992), Litton Cheney (1992), Stockton Park (1994).

Highest mean monthly flow at : Bessom Bridge (1992), Upton (1993), Upton Tributary (1993), Collard Bridge (1995), Bissoe (1994), Beggearn Huish

(1983), Clyse Hole (1992), Helland (1994), Henley (Wookey) (1994), Milverton (1991), Brixton Deverill (1992).

August 1997:

New minimum daily mean flow at : Stowford (1973) 14th, Bath Ultrasonic (1976) 27th, Crab Mill (1969) 18th, Frampton Cotterell (1978) 18th, Frome (1992) 18th, Midford (1961) 20th, Trowbridge (1984) 20th, South House (1993) 20th, Winterbourne Steepleton (1974) 31st, Litton Cheney (1992) 2nd, Amesbury (1965) 16th, Colesbrook (1973) 17th, Laverstock (1965) 12th, Stockton Park (1994) 17th, Upavon East (1971) 20th.

New maximum daily mean flow at : Bessom Bridge (1992) 7th, Broomhill (1988) 5th, Coleford (1989) 5th, Dotton (1962) 7th, Fairmile (1978) 7th, Fenny Bridges (1974) 7th, Salston (1976) 7th, Thorverton (1956) 6th, Upton (1993) 6th, Upton Tributary (1993) 6th, Whitford (1964) 6th, Woodmill (1962) 6th, Yalham Farm (1969) 5th, Collard Bridge (1995) 31st, Bissoe (1994) 4th, Devoran (1994) 4th, Devoran Bridge (1991) 4th, Ponsanooth (1968) 4th, Truro (1968) 4th, St Erth (1968) 4th, West Luccombe (1973) 6th, Beggearn Huish (1983) 6th, Chiselborough (1966) 6th, Ashford Mill (1962) 6th, Swill Bridge (1967) 6th, Bishops Hull (1961) 6th, Clyse Hole (1992) 6th, Curriypool (1971) 5th, Greenham (1967) 6th, Halsewater (1961) 6th, Helland (1994) 6th, Henley (Wookey) (1994) 29th, Milverton (1991) 29th, Iwood (1973) 31st, Pen Mill (1963) 6th, Lovington (1964) 6th, Somerton (1965) 7th, Westhay (1993) 6th, Wraxall (1971) 31st, Bath Hot Springs (1991) 21st, Bath Ultrasonic (1976) 30th, Calstone (1982) 2nd, Sherston, Carriers Fm (1978) 31st, Compton Dando (1958) 31st, Garsden (1992) 31st, Wellow (1966) 29th, Loudsmill (1969) 6th, Stinsford (1992) 6th, Sydling St. Nicholas (1969) 5th, Winterbourne Steepleton (1974) 5th, Dewlish Woodsdown Cross (1992) 6th, East Stoke Flume (1961) 6th, East Stoke Weir (1965) 6th, Hooke (1992) 5th, Brixton Deverill (1992) 5th, Hammoon (1990) 7th, Loverly Mill (1970) 6th, Hurn Court (1992) 6th, Throop (1973) 8th, Walford Mill (1974) 6th, Baggs Mill (1964) 6th, Briantspuddle (1993) 6th, Broadwey (1975) 6th.

New maximum instantaneous flow at : Bessom Bridge (1992) 6th, Broomhill (1988) 6th, Coleford (1989) 5th, Dotton (1962) 7th, Fairmile (1978) 7th, Fenny Bridges (1974) 7th, Salston (1976) 7th, Upton (1993) 6th, Upton tributary (1993) 5th, Whitford (1964) 6th, Yalham Farm (1969) 5th, Collard Bridge (1995) 30th, Bissoe (1994) 3rd, Devoran (1994) 4th, Devoran Bridge (1991) 4th, Ponsanooth (1968) 3rd, St Erth (1968) 3rd.

Lowest mean monthly flow at : South House (1993), Litton Cheney (1992), Stockton Park (1994).

Highest mean monthly flow at : Bessom Bridge (1992), Coleford (1989), Dotton (1962), Fairmile (1978), Salston (1976), Upton (1993), Upton Tributary (1993), Whitford (1964), Woodmill (1962), Collard bridge (1995), Bissoe (1994), Devoran (1994), Devoran Bridge (1991), Ponsanooth (1968), Truro (1968), Beggearn Huish (1983), Chiselborough (1966), Bishops Hull (1961), Ashford Mill (1962), Swill Bridge (1967), Clyse Hole (1992), Curriypool (1971), Greenham (1967), Halsewater (1961), Helland (1994). Henley (Wookey) (1994), Milverton (1991), Westhay (1993), Sherston, Carriers Fm (1978), Tetbury, Slads Farm (1979), Dewlish Woodsdown Cross (1992), Little Puddle (1993), Brixton Deverill (1992), Hammoon (1990), Hurn Court (1992), Briantspuddle (1993).

September 1997:

New minimum daily mean flow at : Fairmile (1978) 27th, Wimbleball (1979) 22nd, Rodbourne (1968) 30th, Trowbridge (1984) 15th, Berkeley Kennels (1978) 30th, South House (1993) 20th, Winterbourne Steepleton (1974) 9th, Litton Cheney (1992) 9th, Amesbury (1965) 27th, East Mills Flume (1963) 24th, Knapp Mill (1975) 30th, Laverstock (1965) 14th, Upavon East (1971) 30th, South Newton (1967) 30th, Wilton (1974) 24th.

New maximum daily mean flow at : Bessom Bridge (1992) 3rd, Upton (1993) 3rd, Upton Tributary (1993) 3rd, Wimbleball (1979) 19th, Collard Bridge (1995) 3rd, Bissoe (1994) 3rd, Devoran (1994) 19th, Henley (Wookey) (1994) 1st, Somerton (1965) 1st, Bath Hot Springs (1991) 8th, Calstone (1982) 11th, Sherston, Carriers Fm (1978) 1st.

New maximum instantaneous flow at: Collard Bridge (1995) 3rd, Bissoe (1994) 19th, Devoran (1994) 19th, Wraxall (1971) 1st.

Lowest mean monthly flow at : Fairmile (1978), Roadford Compensation (1988), Frome (1992), South House (1993), Litton Cheney (1992), Colesbrook (1973), Stockton Park (1994), Upavon East (1971).

Highest mean monthly flow at : Bessom Bridge (1992), Upton (1993), Upton Tributary (1993), Collard Bridge (1995), Bissoe (1994), Devoran (1994), Devoran Bridge (1991), Swill Bridge (1967), Henley (Wookey) (1994), Milverton (1991), Sherston, Carriers Farm (1978), Little Puddle (1993), Brixton Deverill (1992),

October 1997:

New minimum daily mean flow at : Fairmile (1978) 28th, Pen Mill (1963) 3rd, Bath Ultrasonic (1976) 4th, Frampton Cotterell (1978) 4th, Ashford Mill (1962) 2nd, Semington (1953) 31st, Stanley (1970) 4th, Torr Quarry (1981) 1st, Trowbridge (1984) 2nd, Tellisford (1961) 5th, Berkeley Kennels (1978) 5th, East Stoke Flume (1961) 30th, East Stoke Weir (1965) 2nd, Litton Cheney (1992) 7th, Amesbury (1965) 3rd, East Mills Flume (1963) 5th, Hammooon (1990) 17th, Hurn Court (1992) 4th, Laverstock (1965) 1st, Upavon West (1972) 1st, Upavon East (1971) 2nd, South Newton (1967) 1st, Wilton (1966) 2nd.

New maximum daily mean flow at : Devoran (1994) 8th, Curripool (1971) 11th, Helland (1994) 12th, Milverton (1991) 11th, Westhay (1993) 19th, Bath Hot Springs (1991) 6th.

New maximum instantaneous flow at : Upton (1993) 9th, Upton Tributary (1993) 9th, Collard Bridge (1995) 9th, Devoran (1994) 8th.

Lowest mean monthly flow at : Fairmile (1978), Frome (1992), South House (1993), Litton Cheney (1992), Amesbury (1965), Colesbrook (1973), Knapp Mill (1975), Laverstock (1965), Upavon West (1972), Upavon East (1971), South Newton (1967).

Highest mean monthly flow at : Collard Bridge (1995), Devoran (1994), Helland (1994), Brixton Deverill (1992).

November 1997:

New minimum daily mean flow at : Fairmile (1978) 1st, Stowford (1973) 12th, Chiselborough (1966) 3rd, Pen Mill (1963) 4th, Bath Ultrasonic (1976) 19th, Bathford (1969) 2nd, Calstone (1982) 16th, Frampton Cotterell (1979) 3rd, Rodbourne (1968) 1st, Semington (1953) 14th, Tetbury, Slads Fm (1979) 6th, Trowbridge (1984) 1st, Wellow (1966) 3rd, Loudsmill (1969) 1st, Sydling St. Nicholas (1969) 3rd, East Stoke Weir (1965) 4th, Amesbury (1965) 3rd, East Mills Flume (1963) 4th, Knapp Mill (1975) 5th, Hurn Court (1992) 1st, Laverstock (1965) 3rd, Upavon West (1972) 1st, Upavon East (1971) 3rd, South Newton (1967) 3rd.

New maximum daily mean flow at : Goosemoor (1976) 27th, Pophams Farm (1973) 27th, Collard Bridge (1995) 29th, Bissoe (1994) 27th, Devoran (1994) 27th, Tregony (1978) 26th, Clyse Hole (1992) 28th, Sherston, Carriers Fm (1978) 19th, Frome (1992) 20th, Loudsmill (1969) 28th, South House (1993) 27th, Stinsford (1992) 28th, Sydling St. Nicholas (1969) 27th, Upwey (1989) 30th, Winterbourne Steepleton (1974) 27th, East Stoke Flume (1961) 28th, Hooke (1992) 27th, Little Puddle (1993)

28th, Litton Cheney (1992) 27th, All Hallows (1992) 30th, Colesbrook (1973) 20th, Hum Court (1992) 28th, Walford Mill (1974) 27th, Baggs Mill (1964) 28th, Broadwey (1975) 27th.

New maximum instantaneous flow at : Dotton (1962) 28th, Fenny Bridges (1974) 27th, Pophams Farm (1973) 27th, Staplake (1970) 27th, Collard Bridge (1995) 28th, Rockhay Bridge (1988) 28th, Loddiswell (1971) 27th, Crawford Bridge (1972) 28th, Puslinch (1966) 27th, Devoran (1994) 27th, Tregony (1978) 26th.

Lowest mean monthly flow at : Stowford (1973), Wimbleball (1979), Roadford Compensation (1988), Stockton Park (1994).

Highest mean monthly flow at : Fenny Bridges (1974), Goosemoor (1976), Whitford (1964), Bealsmill (1976), Werrington Park (1978), Devoran (1994), Devoran Bridge (1991), Chiselborough (1966), Hurn Court (1992).

December 1997:

New minimum daily mean flow at : Fairmile (1978) 16th, Helland (1994) 1st, Bath Hot Springs (1991) 1st, Frome (1992) 1st, Upavon East (1971) 17th.

New maximum daily mean flow at : Devoran (1994) 26th.

New maximum instantaneous flow at : Devoran (1994) 26th.

Lowest mean monthly flow at : Helland (1994), Bath Hot Springs (1991), Frome (1992).

Highest mean monthly flow at : Collard Bridge (1995), Bissoe (1994), Devoran (1994), Devoran Bridge (1991), Upwey (1989).

3 Surface water gauging stations.

3.1 Introduction.

The primary source of information collected at the sites is water level measured in the stilling well on site. This is continuously monitored and recorded by means of a shaft encoder attached to a solid state digital data logger, or a float and counter balance mechanism connected to a pen and chart recorder. At sites where flows are processed, levels are converted into flows using a stage-discharge relationship. The stage discharge curve can either be derived from a theoretical relationship for a particular type of measurement structure or weir, or from a set of current meter gaugings over a range of levels.

Ultrasonic and Electromagnetic sites are used where the stage-discharge relationship is not stable. Flows are derived by using sound pulses to measure mean velocities at specific depths at ultrasonic sites and by utilising proportional relationships between flow and electromotive forces, generated by flow passing over a coil in the river bed, at electromagnetic sites.

3.2 Station listings and summary statistics

The current site listings showing the reference information for each site, by hydrometric area together with the Area offices responsible for data collection and processing, are presented in Table 4. Reference numbers are the unique numbers used to identify the station records on the archives. Under the heading Control section/Structure, the VA and TR refers to the method by which the rating curve is derived. VA relates to measurements undertaken by current meter gauging with discharges calculated by the velocity area method. Stations labelled TR incorporate gauging structures with known hydraulic characteristics from which a unique stage-discharge relation can be established. In addition to the location and reference information, summary flow information has been provided to outline the range and duration of flows at each site. Q_5 , Q_{10} , Q_{90} and Q_{95} are the flows at each station that are exceeded 5%, 10%, 90% and 95% of the time respectively. Gauge ADF, (Average Daily Flow), measured in cubic metres per second, corresponds to the average of all the daily mean flows taken over the available period of record for the required station. Surface water station locations are shown in Figure 4.

Table 5 presents updated long term average monthly mean flows for the period of record, together with monthly means, maximum and minimum daily mean flows and highest instantaneous flows for each site. The number of sites in the new region and the ease of producing the same statistics from different systems has guided the level of detail being reported in Tables 4 and 5. Reference data are also listed for groundwater support sites in Devon area. Groundwater support stations and spring gauges provide supplementary stream or spring flow data in areas where groundwater resources are used for public and

private water supply.

The accuracy of all the flow stations has been classified, using a nationally consistent method, at low flows (Q_{95} , the flow that is exceeded 95% of the time), medium flows (average daily flow) and high flows (mean annual flood). The gauging station classification is shown in Table 5a. The listing is based upon the initial review that was undertaken in 1995. The classification methodology is being revised to overcome some statistical bias in the methodology and the new classification system will be reviewed and if acceptable will be applied to the sites in time for the next annual report.

Further flow information is provided within Section 6.1 where indicator stations for each area are used to exemplify the standard reporting options available from the archives. In addition to the primary networks a number of special investigation sites were also in operation during 1995. These are listed in Table 5b.

Table 4: SOUTH WEST REGION SURFACE WATER GAUGING STATIONS - CURRENTLY OPERATING SITES
 (Please note all flows are in cubic metres per second)

ENVIRONMENT AGENCY

SOUTH WEST REGION ANNUAL HYDROMETRIC REPORT EVALUATION

PERSONAL DETAILS

Name

Job title

Department Date

Please answer the following questions as fully as possible by circling the appropriate number. The information will be used to assess the effectiveness and completeness of the 1997 report and to identify areas for improvement. All constructive criticism is welcomed.

OBJECTIVES

How successful do you think the report has been in increasing awareness of Hydrometry within the South West Region through detailing hydrometric networks and available data?

1-not achieved, 5-fully achieved

1 2 3 4 5

If not fully achieved, please comment.....

CONTENT/STRUCTURE

How would you rate the report in terms of:

a) Content 1-too elementary, 3-about right, 5-too advanced

1 2 3 4 5

b) Layout/presentation 1-very unsatisfactory, 5-very satisfactory

1 2 3 4 5

Comments

.....
.....
.....
.....

What aspect of the report do you consider most useful/refer to most?

.....
.....
.....
.....

How frequently do you refer to the annual report?

Weekly / Monthly / Yearly / Other (please specify).....

ADDITIONAL FEATURES

Consideration is being given to the inclusion of some additional features to the annual report. Please score the following to assess whether they should be included in the future: (1-low, 5-high)

a) Closed surface water gauging station listing

1 2 3 4 5

b) Map of historic flow sites

1 2 3 4 5

c) Isohyetal rainfall map for the report year

1 2 3 4 5

d) Spot gauging site location map and listings

1 2 3 4 5

ADDITIONAL FEATURES (CONT.)**Comments**

.....
.....
.....

FUTURE ITEMS**Is there any other information you would like to see in the annual report?**

Please indicate need for inclusion (1-low, 5-high)

.....
.....
.....

DATE OF ISSUE**Ideally, when would you like to receive the annual hydrometric report, given time allowances for quality assurance and data collation? The current target date is August, following the report year.****Comments**

.....
.....

OVERALL ASSESSMENT

1-very poor, 5-very good

What is your overall assessment of the report?

1 2 3 4 5

Comments

.....
.....

DISTRIBUTION LIST**Do you wish to be kept on the distribution list for future annual reports? Yes / No****Please list any other staff who require a copy of the annual report**

.....
.....

GENERAL COMMENTS**Please identify areas where you feel the report could be improved and suggest any ideas on how:**

.....
.....
.....
.....

Thank you for taking the time to complete this Evaluation Form. Please return the form to the Regional Hydrology Section, Exeter no later than two weeks after receiving the report.

Table 5: SURFACE WATER GAUGING STATIONS - FURTHER SUMMARY STATISTICS

(Please note any stations missing from this table are a result of data being unavailable - 1) station only recently opened 2) a chart only station or 3) low flow station or owned by someone else.

Area: South Wessex

Notes: T(Theoretical) flows +/- 3%; T2: +/- 3-5%; T3: +/- 5-10%; T4: +/- 10-20%. F1(Flows cmg rated): +/- 3%; F2: +/- 3-5%; F3: +/- 5-10%; F4: +/- 10-20%. S1 levels +/- 2mm; S2: +/- 2-5mm; S3: +/- 5-15mm; S4 > +/- 15-25mm.

: (classification in brackets) : support gaugings are available to confirm the theoretical classification.

: C1: confirmation of +/- 3% theoretical classification. U: comparison of theoretical errors with gaugings has disproved the theoretical accuracy of the site. (either more gaugings or stage only site at this flow)

: E : estimated accuracy awaiting development of program to calculate the theoretical errors of flumes.

: Loverley Mill assumes both hatches closed for Q95 and ADF; but both hatches open for MAF.

: Some Devon Area sites have yet to be classified. In the interim the classification is S1 for low, medium and high flows, though they are primarily low flow investigation sites.

: REL (Reliability Index) R1: >98%, R2: 90% - 98%, R3: <90%

4 Groundwater stations

4.1 Introduction

The groundwater network in Devon & Cornwall is well established. The intensity of data collection and the coverage of the network has been refined to cover just the major aquifers that are utilised and their sub units. The network does not cover hard rock aquifers that are not utilised. A number of sites are monitored continuously using monthly charts to monitor licences. Many of the stations comprising the groundwater network in Wessex, however, have only been in existence for a few years and variations in groundwater levels are still being established. Given that the aquifers are more extensive, stations in Wessex are more numerous and are generally only dipped on a monthly basis.

Measurement intervals at groundwater boreholes within the hydrometric network vary from continuous, on autographic charts and logger sites, to manually investigated fortnightly and monthly readings. Groundwater data is available as an average daily level, for those sites with continuous monitoring, or as a fortnightly or monthly instantaneous spot level at sites that are just dipped. In addition to hydrometric staff taking measurements, voluntary observers undertake readings at 28 boreholes in Devon providing data returns on an annual basis.

4.2 Station listings

The current and historic groundwater sites are listed in Tables 6 and 6a respectively. The listing shows all the sites for which the hydrometric staff maintain records and includes information on regional and local geology. Within each hydrometric operational area, stations are grouped on the basis of the geological period in which the main rock bearing strata, on which the sites are located, have been laid down. Altitude refers to the datum point on the surface from which the measurements of water level in the well/borehole are taken. Reference numbers are the unique numbers used to identify the station records on the archives. Type refers to well (W) or borehole (B).

Further groundwater information is provided within Section 6.1 where indicator stations are used to exemplify the standard reporting options available from the archives.

Table 5b: SOUTH WEST REGION SPECIAL INVESTIGATION SITES

5 Rainfall stations

5.1 Introduction

Rainfall measurements are collected through a network of raingauges maintained and read primarily by unpaid volunteer observers. Rainfall is mainly recorded as a daily total, however some gauges, particularly in remote areas, such as Dartmoor and Exmoor, are checked monthly and only return monthly totals. Observers make data returns each calendar month to the hydrometric section. The returns for each gauge are input to the archive on Rainmark and copies to the Meteorological Office by the 20th of the month, where quality control procedures are undertaken. The Meteorological Office undertake quality control of rainfall data on a national basis and data is returned 2 to 3 months later to be fully archived.

A network of tipping bucket raingauges is also in operation which allow interrogation of rainfall intensities. These raingauges have been included in the North and South Wessex listings as hydrometric staff visit these sites. In Devon and Cornwall the intensity gauge networks are currently primarily used operationally by Flood Warning staff and have not been included in the report as they are not maintained and quality controlled by hydrometric staff. Data for a further 11 sites distributed around Devon and Cornwall, are telephoned directly through to the EA from the Meteorological Office in Bristol as daily rainfall totals. These rainfall readings together with those collected from the raingauge in the car park at Manley House in Exeter are used as daily rainfall indicator stations. Further details on the availability of rainfall information for these sites are provided in Section 7.2.

5.2 Station listings and summary statistics

Current and historic rainfall sites are listed in Tables 7 and 7a respectively by operational hydrometric area. The Meteorological Office reference numbers are the unique numbers used to identify the station records on the archives. Station numbers on HIPS use the Meteorological Office reference number with the prefix RF. National grid references and altitudes are shown for each station together with the 1961-1990 long term averages, which is the national standard comparison period currently in use. Periods of record available at each site are referenced by inclusion of the first year on record. The frequency of observations has been derived from the annual Rainmaster listing of current sites supplied by the Meteorological Office and an index of terms accompanies Table 7.

TABLE 7: SOUTH WEST REGION RAINFALL STATIONS - CURRENTLY OPERATING SITES AND SUMMARY STATISTICS

KEY

- M.O. REF. NO. = METEOROLOGICAL OFFICE REFERENCE NUMBER
 FREQUENCY OF OBSERVATIONS FROM STANDARD RAINGAUGE
 D = DAILY OBSERVATIONS
 S = FIVE OR SIX DAY WEEK OBSERVATIONS (WEEKEND ACCUMULATIONS)
 I = IRREGULAR READINGS (OVER THREE PER MONTH)
 M = MONTHLY TOTALS ONLY
 RAIN RECORDER EQUIPMENT
 R = TILTING OR NATURAL SYPHON PATTERN CHART RECORDER
 E = TIPPING BUCKET RECORDER WITH TELEMETRY
 B = BOTH TYPE R AND E
 S = SERVELEC
 C = TYPE R WITH CO-LOCATED CHECK GAUGE OR TIPPING BUCKET AVAILABLE
 D = TYPE E WITH CO-LOCATED CHECK GAUGE OR TIPPING BUCKET AVAILABLE
 X = NO LONGER OPERATES A RECORDER (HAD EITHER TYPE R OR E)

Area: South Wessex (Cont...)

6 Standard reporting options from current systems:

6.1 Introduction

Hydrometric archives have now been converged onto the Hydro-Logic suite of software, namely Hydrolog, Rainark and Gaugeman. The data archiving systems and standard reports for data analysis and presentation are briefly outlined to help staff tailor their information requests. Additional hydrometric reports and sources of information are also included for reference in section 7.0.

6.2 Surface water

The number of sites in the South Western Region precludes showing summary reports for all stations. Summary information for all sites has been included earlier in this report along with the station listings in Section 3.1. Current meter gauging information is being migrated from GWARK, Gaugeman and an Access 2 database into the national BIS spot gaugings database available to users with Access 97.

Flow and level information for the region can be accessed through Hydrolog. Special investigation sites (groundwater and surface water) monitored by dataloggers in Devon and Cornwall are also available on Hydrolog. Hydrolog has a wide range of tabular and graphical reporting options. Multi-station and multi-parameter hydrograph plots are possible with user defined periods and scales through 'Station reports' menu option. Indicator stations have been selected from each of the 4 areas to indicate the range and nature of flows in the catchments and to illustrate some of the standard reporting options available (Figures 7, 8 & 9). 'Summary report' options include monthly mean summaries (Figure 9). 'Long term comparison' reports are available from the 'Hydrological statistics' menu in graphical format covering instantaneous flows, maximum and minimum instantaneous flows, daily mean flows and monthly mean flows for the period of record at stations (Figure 7). 'Daily mean duration/frequency analysis' reports within the 'Hydrological statistics' menu can be reported as a flow duration curve or in tabular form (Figure 7). HIPS format reports are still available from the Hydrolog system using the SW reports module in the utilities module. These include annual (R143 report) and monthly (R106 report) summaries of river flow (Figure 8).

Figure 7: Devon and Cornwall surface flow annual reports and flow duration curves

Name: Tellisford

Locat.: Somerset Frome

Period of Analysis : 1962 to 1997 (36 complete years used)

6.3 Groundwater

Groundwater data for the whole region is now stored on Hydrolog. Groundwater data from special investigation sites is also stored on Hydrolog. Hard copy lists of the data can be printed from the system.

6.4 Rainfall

Rainfall information is stored on Rainark throughout the region. As with Hydrolog, the graphical and tabular reports can be user defined. Standard reporting options include hourly totals for months, daily totals for years and monthly totals for decades within screenform reports and graphical options within screengraph reports. Information can be exported on hard copy or spreadsheet compatible files.

7 Other sources of information

7.1 Scope

SCOPE provides the latest data from the telemetered river and rainfall stations. The system can be only used for recent data enquiries as only the last 100 days is stored and the data is not quality controlled. Flow information is available for North and South Wessex, whilst only level data is currently available for Devon and Cornwall.

7.2 MORECS

- Weekly and monthly summaries of MORECS (The Meteorological Office Rainfall and Evaporation Calculation System) data are received from the Meteorological Office and are stored in the regional hydrometric office at Exeter. Copies of the weekly and monthly data are faxed to the area offices. Information is received for rainfall, potential evaporation, actual evaporation and soil moisture deficit information for all MORECS squares in the South Western region each week. Monthly summaries for all the MORECS squares in the South Western region feature information on (SMD) soil moisture deficit (mm), (PE) potential evaporation (mm), (EP) effective precipitation (mm), (AE) actual evaporation (mm), ((ST) AE/PE) stress, (S) sunshine (hours), (T) temperature (°C), (VP) vapour pressure (mb), (WS) wind speed (miles/day) and (R) rainfall (mm). Weekly and monthly MORECS 2 information together with long term averages is available for all squares from January 1961 onwards.

7.3 Reservoir storages

Reservoir storage information is received from South West Water Plc, Bristol Water Plc and Wessex Water Plc each week by regional hydrometric staff. Reservoir storage data

Data is available for South West Water Plc from January 1966, Bristol Water Plc from January 1989 and Wessex Water Plc from January 1975.

7.4 Water situation reports

Current water resources situation information is also available from the following routinely produced reports:

The **regional monthly hydrometric report** is produced by regional hydrometric staff. The report provides a monthly overview on the current water resources situation for the whole South West region. It includes a water resources situation text summary together with statistical and graphical summaries comparing indicator stations with long term averages. These cover rainfall totals and percentage of long term averages, soil moisture deficits, current groundwater levels, percentage of mean monthly flows and total company reservoir storages & strategic reservoir storages.

During and following 'drought' periods a **water resources situation update report** is produced covering the region on a weekly basis by regional hydrometric staff for as long as conditions require. This report contains compares current instantaneous flows, monthly mean flows, groundwater levels, reservoir storages against long term averages.

Area monthly hydrometric reports are produced by North and South Wessex areas. These reports contain a text summary outlining the water resources situation, followed by graphs and tables to report the rainfall, soil moisture deficit, groundwater, river flows and low flow situation using a number of indicator sites to cover the area in detail.

South West Water Plc produce a **water situation report** each week which reports on demand in the supply areas; rainfall indicator sites, flow indicator sites, reservoir storages, groundwater situation and a 25 day forecast supplied by the Meteorological Office.
