GLOSSARY

RIVER REACH	A segment of water, upstream from sampling point to the next sampling point.
RIVER LENGTH	River distance in kilometres.
RIVER QUALITY OBJECTIVE	The statement or category of water quality that a body of water should match, usually in order to be satisfactory for use as a fishery or water supply.
COMPLIANCE ASSESSMENT	A procedure applied to the results of a monitoring programme to determine whether or not a water has met its agreed Quality standard.
QUALITY STANDARD	A level of a substance or any calculated value of a measure of water quality, which must be met in order to protect a given use of a water body. The standard is expressed as a pairing of a specific concentration or level of a substance with summary statistics such as a percentile or maximum.
95 PERCENTILE STANDARD	A level of water quality, usually a concentration, which must be achieved for at least 95% of the time.
5 PERCENTILE STANDARD	The amount of oxygen dissolved in water. Oxygen is vital for life, so its measurement is important, but highly variable, test of the 'health' of a water, it is used to classify waters.
BIOLOGICAL OXYGEN DEMAND (ATU)	These are measures of the amount of oxygen consumed in water, usually by organic pollution.
	The simple BOD value can be misleading because much more oxygen is taken up by ammonia in the test than in the natural water. This effect is suppressed by adding a chemical, Allylthiourea (ATU), to the sample of water taken for testing.
pH	A scale of acid to alkali.
AMMONIA	A chemical which is often found in water as a result of the discharge of sewage effluents. It is widely used to characterise water quality. High levels of ammonia adversely affect the quality of water for fisheries and abstractions for potable water supply.

UNIONISED AMMONIA	A fraction of ammonia poisonous to fish.
SUSPENDED SOLIDS	Solids removed by filtration or centrifuge under specific conditions.
USER REFERENCE NUMBER	Reference number allocated to a sampling point.
INFERRRED STRETCH	Segment of water which is not monitored and whose water quality classification is assigned from the monitored reach upstream.
UNMONITORED STRETCH	Segment of water which is not monitored and for which it is considered inappropriate to assign a water quality classification, from the upstream monitored reach, or where it is prior to an impoundment.
CLASS 'N'	Insufficient sample's to calculate a water quality class.

APPENDIX 2

1. INTRODUCTION

The objective of this report is to present the results of the River Water Quality Classification for the three year period 1988-90. Classification is based on the NWC system in which key determinants are tested against target criteria (refer to Appendix 1). In addition, as a result of inconsistencies in the classification program, there were the following amendments to the method used in 1989:

- 1) Suspended solids was tested as a mean not as a median
- 2) Results archived as being ' greater thans ' were taken at actual value and included in assessments.
- 3) Temperature criteria for Class 2 was corrected from 21.5°C to 28°C.

These changes mean that direct comparisons with previous classifications should be treated with caution.

Comparisons are made with the river quality assessments for the three year period ending December 1989 (see 2.2, 2.3). River reaches common to both survey periods are included for this comparison, river reaches not common have been summarised (see 2.1).

Compliance with existing River Quality Objectives(RQO's) for all reaches have also been examined. River reach quality has been inferred where appropriate.

2. RESULTS

2.1 River Quality Classification

Where sufficient data exist, each river reach in the monitored network has been classified into one of the following categories:

Quality Class	Description
1a	Good Quality
1b	Lesser Good Quality
2	Fair Quality
3	Poor Quality
4	Bad Quality

4048.1 kilometers of rivers were classified in 1990 as shown below:

Class	km	%
1a	563.5	13.9
1b	1425.4	35.1
2	1255.7	30.9
3	753.1	18.6
4	60.4	1.5

For detailed results refer to Appendix 1.

2.2 Comparison of 1990 with 1989

When river lengths common to both the 1987-89 and 1988-90 periods are compared, the total length available is 3131.2 km. All river reaches reported in 1989 have been remeasured, sources redefined and inferred reaches included for the following assessments.

The distribution of river lengths in each class is shown below.

Class	1987-89 km	1988-90 km	% Change
1a	443	476	+ 7.6
1b	1111	1132	+ 1.9
2	1139	902	-20.8
3	395	577	+46.1
4	43	44	-2.3

This represents a net improvement in river quality, particularly in those reaches previously classified as Class 2. A more detailed analysis reveals significant migration across class boundaries which reflects the variable nature of river quality and the statistical uncertainty of classification.

Changes in river length(km) from 1989 to 1990

Class	1989 length	length un- changed	length downgraded to				length upgraded to			
			1b	2	3	4	1a	1b	2	3
1a	443	241	113	53	34	2	-	-	-	-
1b	1111	718	-	144	82	0	167	-	-	-
2	1139	612	-	-	187	7	64	269	-	-
3	395	265	-	-	-	13	4	31	82	-
4	43	22	-	-	-	-	-	1	11	9

1858 km (59%) of the river network have remained within class. 638 km (20%) have moved up and 635 km (20%) have moved down. Of the changes identified 77% (984 km) are into an adjacent class. This " change " is within the statistical confidence limits associated with the estimates of river quality parameters.

2.3 Compliance with RQO's is summarised below:

(This Table relates to the full 1990 survey results and is not comparable 1989.)

RQO	River Quality Classification 1990, length in km				
	1a	1b	2	3	4
1a	314	449	338	114	7
1b	244	955	864	498	33
2	3	22	43	109	31
3	2	0	10	32	0
4	0	0	0	0	0

Everything below the stepped line complies with RQO's and everything above the line is non-compliant. 1625 km comply with their RQO's, representing 40% of the total. 2433 km(60%) do not comply although 1422 km fail by one class.

RQO compliance by catchment is shown in Appendix 2. The catchments of the Rivers Lynher, Seaton, Dart, Plym and Cober continue to show a low level of compliance. There has been considerable improvements in the River catchments of Helford, Cober, Forth and Strat, but the the Rivers Dart, Avon, Erme, Plym and Valency have exhibited a major decline.

3. DISCUSSION

51% of the classified river network was in Class 1. When compared with 1989(49.6% using corrected river lengths) there has been a slight improvement in river quality. The proportion of Class 3 and 4 has increased slightly. Compliance with RQO's has risen marginally from 41.7 in 1989(using corrected river lengths) to 42.2% in 1990. The majority of these failures are by one NWC class, however, this low level of compliance remains a concern.

Data used for the 1990 classification included those collected during two droughts, whereas only one drought occurred in the 1989 classification period. This probably contributed to the continuation of the general low level of RQO compliance in the Region.

The principal reasons for non-compliance were high biochemical oxygen demand and ammonia, and low dissolved oxygen, all indicative of organic pollution. Other reasons for non-compliance were high suspended solids, copper and zinc , or low pH and high temperatures. The principal causes remain land use practices, and historic mining and associated contaminated land. Notable improvements include River Torridge, where most of the main river is now within its target class of Class 1b. The Red River improved from Class 4 to 3, as a result of reduction in pollution from mines.

3.1 Prospects

A series of Catchment Action Plans are being drawn up as a simple and practical way of directing resources. The public are being consulted on the Plans. Special Task Forces will continue to be deployed in those catchments where water quality falls short of standards, ensuring effective and rigorous pollution control. There is current considerable programme of Capital Investment by industry, including 150 schemes by South West Water PLC to improve discharges to freshwaters. The region is embarking on a more active campaign to prosecute illegal or non-compliant dischargers. It is hoped that this will deter offenders and reduce river pollution. Priority investigations into non-compliance producing Class 3 and 4 rivers, are now undertaken by a freshwater investigation team.

APPENDICES

APPENDIX 1

NATIONAL WATER COUNCIL (NWC) RIVER CLASSIFICATION SYSTEM

CRITERIA USED BY NATIONAL RIVERS AUTHORITY - SOUTH WEST REGION FOR NON-METALLIC DETERMINANDS

River Class	Quality Criteria
1A	Dissolved oxygen & saturation greater than 80% BOD (ATU) not greater than 3 mg/l O Total ammonia not greater than 0.31 mg/l N Non-ionised ammonia not greater than 0.021 mg/l N Temperature not greater than 21.5 C pH greater than 5.0 and less than 9.0 Suspended solids not greater than 25 mg/l
1B	Dissolved oxygen & saturation greater than 60% BOD (ATU) not greater than 5 mg/l O Total ammonia not greater than 0.70 mg/l N Non-ionised ammonia not greater than 0.021 mg/l N Temperature not greater than 21.5 C pH greater than 5.0 and less than 9.0 Suspended solids not greater than 25 mg/l
2	Dissolved oxygen & saturation greater than 40% BOD (ATU) not greater than 9 mg/l O Total ammonia not greater than 1.56 mg/l N Non-ionised ammonia not greater than 0.021 mg/l N Temperature not greater than 28 C pH greater than 5.0 and less than 9.0 Suspended solids not greater than 25 mg/l
3	Dissolved oxygen & saturation greater than 10% BOD (ATU) not greater than 17 mg/l O
4	Dissolved oxygen & saturation not greater than 10% BOD (ATU) greater than 17 mg/l O

STATISTICS USED BY NATIONAL RIVERS AUTHORITY - SOUTH WEST REGION

Determinand	Statistic
Dissolved oxygen	5 percentile
BOD (ATU)	95 percentile
Total ammonia	95 percentile
Non-ionised ammonia	95 percentile
Temperature	95 percentile
pH	5 percentile
Suspended solids	95 percentile arithmetic mean

NATIONAL WATER COUNCIL (NWC) RIVER CLASSIFICATION SYSTEM

CRITERIA USED BY NATIONAL RIVERS AUTHORITY - SOUTH WEST REGION FOR METALLIC DETERMINANDS

SOLUBLE COPPER

Total Hardness (mean) mg/l CaCO ₃	Statistic	Soluble Copper*	
		ug/l Cu Class 1	ug/l Cu Class 2
0 - 10	95 percentile	< = 5	> 5
10 - 50	95 percentile	< = 22	> 22
50 - 100	95 percentile	< = 40	> 40
100 - 300	95 percentile	< = 112	> 112

* Total copper is used for classification until sufficient data on soluble copper can be obtained.

TOTAL ZINC

Total Hardness (mean) mg/l CaCO ₃	Statistic	Total Zinc ug/l Zn		
		Class 1	Class 2	Class 3
0 - 10	95 percentile	< = 30	< = 300	> 300
