INVESTIGATION OF FLOWS AND LEVELS  
AT WEAHAMPSTEAD MILL UPPER LEE.

10 JANUARY 1994

ENVIRONMENT AGENCY

123187

## INVESTIGATION OF FLOWS AND LEVELS AT WHEATHAMPSTEAD MILL UPPER LEE.

### 1.0 Objective

The observed flood data of events 29/30 May and 23rd September 1992 had given some reasons for further investigation on the hydrology and hydraulic modelling of the Wheathampstead Mill, Upper Lee.  
The objective of this investigation is to determine whether there is a substantial input between Luton Hoo gauging station and the Mill and to quantify .

### 2.0 Data used

#### 2.1 Flows at Luton hoo gauging station

Files used are 4640aug9.3,4640sep9.3,4640oct9.3 .  
Each chart starts at 9.15, flows at 15 mts interval for the months of August ,September and October 1993.

2.2 Temporary loggers were installed at the Mill, one upstream and one down stream of the mill.

Files used are: u/s of mill 961708.193 961709.193 961710.193 and  
d/s of mill 961808.193 961809.193 961810.193.

Each chart starts at 9.15, flows at 15 mts interval for the months of August ,September and October 1993

Top of d/s logger box =79.905 m

Top of u/s logger box =81.198 m

Levels shown on print out start 10m below top of logger box

D/s logger 0 =69.905 m

U/s logger 0 =71.198 m

#### 2.3 Current meter results

##### Leasy bridge at Cherry tree lane d/s rd bridge

stage 1.973 m	flow 0.8917 cumecs	09 Aug 1993
stage 0.26 m	flow 0.8529 cumecs	18 jul 1991
stage 0.13 m	flow 0.4699 cumecs	15 aug 1991
stage 1.95 m	flow 1.9785 cumecs	07 dec 1992
stage-1.925 m	flow 1.1330 cumecs	24 jun 1993 local datum

Current meter readings are not used in the analysis

## 2.4 Control structure at Wheathampstead bridge mill (Existing situation)

number of weirs 3.

	side weir1	side weir2	trans weir3
crest level	78.780 m	79.560 m	79.350 m
width crest	1.00 m	2.860 m	2.795 m
length crest	--	1.00 m	0.75 m

Weirl and weir2 are side weirs and discharge into by-pass channel

Weir3 is across the channel and discharge into the Mill culvert.

At a flood level of 80.190m, weir3 will act as an orifice when flow will be restricted by beam with a soffit level of 79.91m, 0.560 m above crest level. Upto 1.5\* 0.560m depth above weir crest is level 80.190m the weir3 will act as a free weir and above this level the opening will behave as an orifice.

## 2.5 Approach channel

width	7.00 m
bed level	78.20 m

## 2.6 Additional flow data

There are two sewage works, Luton STW and Harpenden STW. Effluent discharges d/s of gauging station at Luton Hoo and u/s of Wheathampstead Mill weirs. Input from Luton STW is available as daily total flow in cubic metres.

From given information for the periods 20th of May 1992 to 10th June 1992 and 15th of September 1992 to 25th September 1992, from Luton STW, lowest daily flow is 30300 cubic metres and highest is 45666 cubic metres. The volume consent is 44418 m<sup>3</sup>/day. The works can cope with six times dry weather flow which is 35000 - 40,000 cubic metre per day. There are 5 storm tanks of 2500 cubic metre each. The storm tanks act as detention storage. The system is quite adequate for most of the rainfall events.

NO INFORMATION IS AVAILABLE FROM Harpenden STW.

## 2.7 Quality of data

- . The loggers were not functioning for the period 19th Oct - 31st Oct 1993.
- . 12th of August 1993 from 9.15 to 10.30 data is suspect .
- . u/s level and d/s level does not correlate well, some inconsistencies .

### 3.0 Analysis

Analysis of logger data and gauged flows for the three months August September and October 1993.

Based on the gauged flows at Luton Hoo for the period 1st of August 1993 to 18th of October 1993, data were grouped into days with low flows and days with high flows.

The days when daily maximum flow is less than 0.200 cubic metre per second are considered as days with low flows with no appreciable direct runoff.

The days when daily maximum flow is more than 0.900 cubic metre per second are considered as days with high flows with appreciable direct runoff.

#### 3.1 Low flow studies

The following is a summary of results for the low flows:

Table 1.0

date	01.08.93	06.08.93	07.8.93	08.08.93

## 3.2 Summary of results based on tables 1.0 to 1.8

On no rain situation characteristics , of total input d/s of Luton Hoo and u/s of Mill are as follows.

Daily maximum input varies between 0.50 cumecs to 0.67 cumecs

Daily minimum input varies between 0.18 cumecs to 0.28 cumecs

Daily average input varies between 0.35 cumecs to 0.47 cumecs

Ratio daily max/average range from 1.30 to 1.50

Ratio daily min/average range from 0.49 to 0.60

Daily total input in cubic metres varies from 32500 to 41600.

3.3 Diurnal variation of input d/s of Luton Hoo and Mill in cumecs  
starting at 9.15 at 15 minuits intervals.

### 3.4 Conclusion

On no rain days d/s of Luton Hoo the only input is from Luton STW and Harpenden STW. Table 1.0-1.8 and table 2.0-2.1 and para 3.2 agrees well with data from Luton STW (para 2.6) and that of a typical treatment station. The computations of flows from logger levels is based on the Nov 1992 report 'Upper Lee Improvement Scheme Bridge Mill Wheathampstead Hydraulic Analysis'. The hydraulic modelling is therefore satisfactory.

### 3.5 High flow studies

The following is a summary of results for the high flows:

Table 3.0

Date	12.08.93	30.09.93	01.10.93	12.10.93	13.10.93
max flow at gauging station	1.779	.945	.996	3.122	3.699
max flow at u/s mill	3.379	3.304	3.634	5.569	7.820
max level at u/s mill	79.728	79.721	79.751	79.904	80.061

### 3.6 Summary of results based on above table

On rain fall days, characteristics of total input d/s of Luton Hoo and u/s of Mill are as follows:

Daily maximum input varies between 5.50 cumecs to 2.43 cumecs

Daily maximum less STW flow varies between 4.80 cumecs to 1.93 cumecs

Daily total input in cubic metres varies from 138,000 to 337,000

Daily total input less STW flow in cubic metres varies from 108,000 to 270,000

3.7 Diurnal variation of input d/s of Luton Hoo and Mill in cumecs  
starting at 9.15 at 15 minutes intervals.

### 3.8 Conclusion

On wetdays, d/s of Luton Hoo the total input is from Luton STW, Harpenden STW and from catchment area beween Luton Hoo and the Mill. The capacity of the Storm tanks at the Luton STW is 12500 cubic metres and had never overtapped. Hence rate of discharge from STW to Lee is not expected to exceed 0.6 cumecs even during heavy rainfall. Allowing 0.2 cumecs from Harpenden, the peak discharge from both Luton and Harpenden treatment stations is of the order of 0.8 cumecs.

October 1993,peak input from the STW and the d/s catchment is 5.5cub.mtre per sec. Hence the flow from d/s catchment alone is about 4.7 cumecs about 127% of the peak flow at the Luton Hoo gauging station.

Table 3.0 and table 4.0- 4.1 and para 3.6 shows that there is a substantial input from the catchment area between Luton Hoo and Wheathampstead Mill. This is as high as 1.3 times, even higher, the peak flow at Luton Hoo gauging station and this has to be investigated further.

4.0 It is recommended that an additional logger be installed in the by-pass channel to monitor the losses in the by-pass system .The computed losses in the by-pass system based on the observed levels for the 23rd September 1992 flood event is low and needs further observations.
