REPORT ON NRA PROJECT TO UPDATE CONTROL AREA POPULATION AND ACORN PROFILES

JULY 1995

NRA SOUTHERN REGION

CONTROL AREA GROUP

REPORT ON NRA PROJECT TO UPDATE CONTROL AREA POPULATION AND ACORN PROFILES

JULY 1995

1) Summary

In 1994 Mid Kent, Folkestone and South East Water Companies undertook surveys for the Control Areas within their own company areas to update population and household estimates. These surveys highlighted the major changes that have taken place since 1986 and the urgent need to update these figures for all the Control Areas.

This report describes the work carried out by the NRA to update population and ACORN estimates on a consistent basis using census data and information provided by CACI.

The results of the NRA work show major differences from the estimates made for the original study in 1986 and indeed the surveys carried out by the water companies in 1994. The results therefore cannot be taken as being conclusive and further work needs to be undertaken.

This work has also highlighted the need to regularly update the background Control Area information, probably every 2-3 years. A key element of any further work must therefore be repeatability.

2) Introduction

Ten months ago the Southern Region of the NRA embarked upon a project to update the population estimates and Acorn profiles for each of the 66 Control Areas, the SWS 7 supply areas, the 5 water company areas and the NRA Southern Region as a whole.

This work took place as a result of the surveys carried out by Folkestone, Mid Kent and South East Water companies which demonstrated that large changes in the population base have taken place.

The NRA undertook to update the population estimates on a consistent basis for all the Control Areas. This also meant that the Acorn profiles also had to be revised in line with the new population estimates.

This report outlines the work involved, the methodologies used and the results.

3) Methodology

3.1 General

The most up to date data available covering all the individual Control Areas, company supply areas and the NRA Southern Region is the 1991 Census results. The applicability 4 years on is a source of concern however.

It was decided to break each Control Area down into its constituent Enumeration Districts (EDs) and build up the population estimates and Acorn profiles from this basic unit. This is the smallest unit at which population / household data is available from the 1991 census. All this information was purchased from OPCS at minimal cost.

3.2 Population Data

The steps taken in updating the populations were as follows (a worked example is included as Section 3.4):

- i) Water company base maps of each Control Area showing the boundary and individual properties were used as the base for carrying out the work. Up to date maps were obtained where necessary. In the case of SWS a completely new set of maps were provided. Household counts from the maps were cross checked with those derived from the company survey work. Where these differed by a small amount (2-3 households) the company survey results were taken as being correct.
- ii) On each of these base maps the ED boundaries were drawn. The ED boundaries were calculated using 1:10000 scale maps provided by the OPCS. These maps were of sufficient detail to show properties and this was therefore a simple but time consuming job. The number of households apportioned to each ED within the Control Area was then counted.
- iii) The average occupancy rate for each ED as was calculated by the NRA using the household and population counts provided by OPCS for each ED. This average occupancy rate was assumed to apply to the portion of the ED within the Control Area. This is clearly the main source of error in the technique used by the NRA as occupancy rates are not uniform.
- iv) For each ED within the Control Area, the household count for that part within the Control Area boundary was multplied by the occupancy rate to give the population estimate.

v) The estimates for each ED were then aggregated to give the population for each Control Area.

The basic data for each Control Area is shown in Appendix 1.

<u>3.3</u> <u>Acorn Profiles</u>

The Acorn profiles were updated in a similar manner to the population data using ACORN data provided by CACI. The ED is also the smallest block used by CACI.

CACI provided for each ED a unique ACORN reference. This was then applied to each ED within the Control Area.

Where EDs were classified as D or G (ie those not used in the Control Area project) they were reassigned to the nearest classification (D to C and G to F). No A or H areas were identified.

<u>3.4 A Worked Example: Francis Rd. Ashord (see P1 of Appendix)</u>

- i) This Control Area has 182 households (from Mid Kent survey)
- ii) Three EDs cover the Control Area: FLO3, FSO3, FG02
- iii) The calculation for the Control Area is as follows:

ED	Average Occupancy Rate (estimated by NRA)	No. Households within Control Area	Population (Occ rate × households)	Acorn Profile CACI data
FLO3	2.65	4	11	F
FSO3	2.72	138	376	С
FG02	2.63	40	105	E
Total		182	493	11F, 376C, 105E

÷ -

iv) The population of the Area is as 493. The Acorn profile is therefore 11F, 376C, 105E.

4 Results

4.1 Households / Population

- 4.1.1 When the Control Area project was set up in 1986 the total households were estimated as 17289. As a result of this work the figure has fallen to 16981, a decrease of 308.
- 4.1.2 The 1986 estimate of population was 45359. The figure is now estimated to be 41296, a decrease of 4063 or 9%.
- 4.1.3 The individual results are shown in Table 1.

4.2 Occupancy Rate

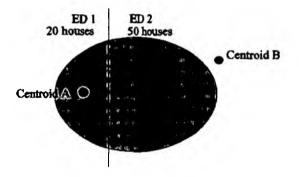

- 4.2.1 The occupancy rate in 1986 was 2.62 persons per household (based on 1981 census data). The average rate as a result of this work is 2.43 persons per household (1991 census data). This has been compared with the statistics for the NRA Southern Region as a whole.
- 4.2.2 For the Region as a whole the average occupancy rate in 1981 (the base data used forr the 1986 population estimates was 2.8. This decreased to 2.54 in 1991. These figures are higher than the Control Area results but do show that the decrease in occupancy rate was a general region-wide phenomenon..

4.3 Acorn Profiles

- 4.3.1 The results of this work are shown in Table 2 (actual profiles) and Table 3 (profiles as a percentage) for the old data, the revised data and the changes between the two.
- 4.3.2 Table 3c highlights the changes in Acorn profiles.
- 4.3.3 The results show large amounts of change between the two surveys. 10 Control Areas have changed categories completely. Changes between B and J are understandable, group B being "modern family housing, higher incomes" and J being "affluent suburban housing". However other changes do not have obvious expalanations. For example Hoath Village, Canterbury has changed from C "older housing of intermediate status to B "modern family housing, higher incomes".
- 4.3.4 The reason for these changes is not clear but must be a result of errors. There are five possible explanations:
 - i) CACI made errors in the original definition of the Acorn profiles.
 - ii) The difference in methodology (discussed further in 4.3.5) between using all EDs on a proportional basis (NRA method) and using ED centroids (CACI method).

- iii) Changes in ED boundaries between the 1981 and 1991 census.
- iv) errors in the work carried out by the NRA.
- v) inherent uncertainty in attaching ACORN classes to EDs
- 4.3.5 The work carried out by the NRA used a slightly different method from that used by CACI. The NRA work as already discussed used all the EDs within a Control Area on an equal basis whereas CACI originally used a "weighted centroid" approach to apportion Acorn profiles. The weighted centroid approach is to derive a central point for an ED based on the distribution of properties within that ED. When classifying a Control Area CACI only use data from an ED if the centroid falls within the Control Area. This would seem to be a cause of greater errors at a small scale however as it could exclude the majority of properties.

The figure right shows how problems can occur with CACIs approach. The Control Area (grey circle) has 70 houses, of which 20 are in ED1 and 50 in ED 2. The centroid of ED 1 (A) is within the area but the centroid of ED 2 (B) is not. Therefore the classification of the Control Area will be based entirely on ED1 and totally ignore the 50 houses in ED 2.

This has been discussed with CACI who are only willing to discuss differences in results on a "project basis" with payment.

5 The Way Ahead

- 5.1 This project has clearly by no means provided definitive answers to the problem of estimating populations and Acorn (or other system) classification for profiling consumers.
- 5.2 The results are significantly different from those derived from the studies done when the Control Area study was set up. The results are also in many cases different from those obtained as a result of the surveys carried out by the water companies in 1994.
- 5.2 This problem will therefore have to be addressed further by the NRA during 1995.

Issues to be addressed are:

- relative merits of OPCS census data versus postal and doorstep surveys as a means of population estimates.
- accuracy in defining Control Areas in terms of boundaries and household numbers.
- relaibility of the ACORN classification at small scales.
- representativeness of the Control Areas as a sample of the Region.

RESULTS OF POPULATION UPDATE
